Official Data shows Children are up to 52 times more likely to die following Covid-19 Vaccination than Unvaccinated Children & the ONS is trying to hide it

BY THE EXPOSÉ ON JANUARY 29, 2022 • (19 COMMENTS)

Listen Now

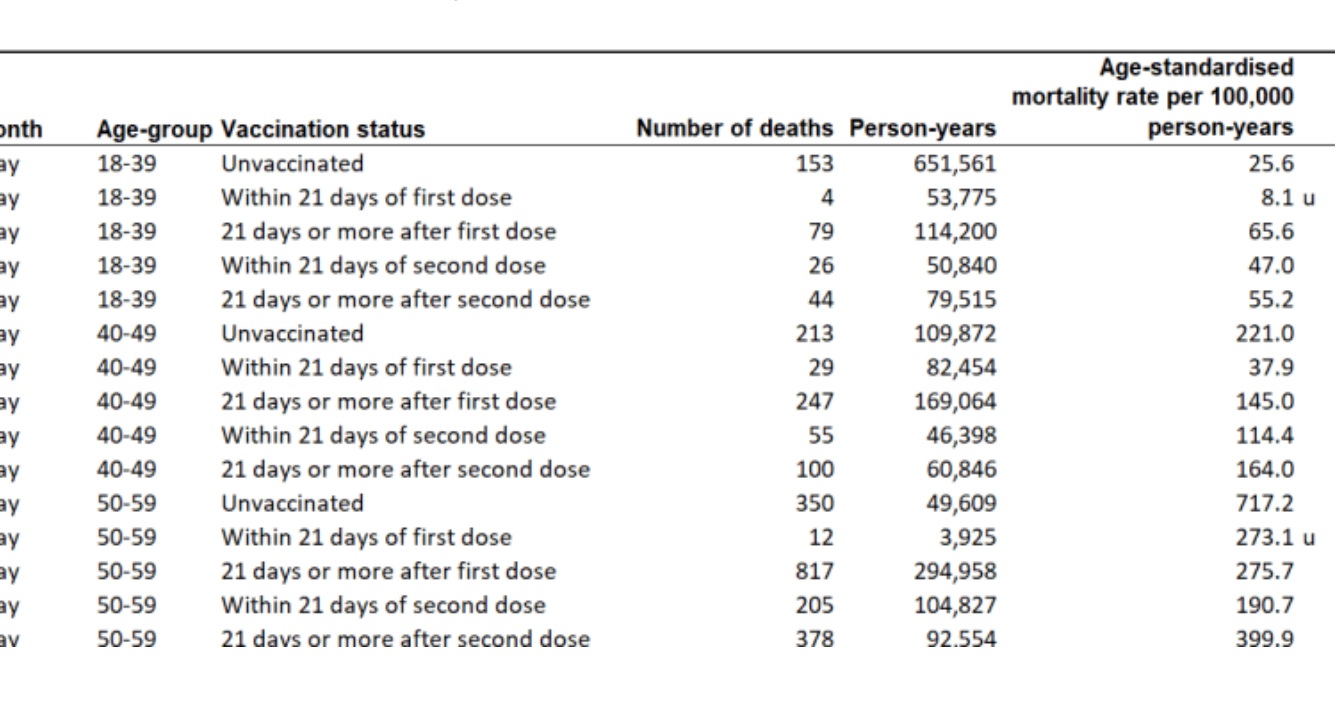
The Office for National Statistics has revealed without realising it that children are up to 52 times more likely to die following Covid-19 vaccination than children who have not had the Covid-19 vaccine.

Back on 20th Dec 21, the Office for National Statistics (ONS) published a dataset containing details on 'deaths by vaccination status in England' between 1st Jan and 31st Oct 21.

The dataset contains various tables showing details such as, 'Monthly age-standardised mortality rates by vaccination status for deaths involving COVID-19', and 'Monthly age-standardised mortality rates by vaccination status for non-COVID-19 deaths'.

What the dataset also includes is 'age-standardised mortality rates by age-group and vaccination status for all deaths', however they have conveniently left out the data for children, and only included data on age groups over the age of 18.

What they also did in the data they included is bunch all young adults together meaning the rates of death are calculated for 18-39 year-olds, a total of 22 years. But for every other age group the rates of death are calculated for a total of 10 years, with 40-49, 50-59 etc.



Month	Age-group	Vaccination status	Number of deaths	Person-years	Age-standardised mortality rate per 100,000 person-years
May	18-39	Unvaccinated	153	651,561	25.6
May	18-39	Within 21 days of first dose	4	53,775	8.1 u
May	18-39	21 days or more after first dose	79	114,200	65.6
May	18-39	Within 21 days of second dose	26	50,840	47.0
May	18-39	21 days or more after second dose	44	79,515	55.2
May	40-49	Unvaccinated	213	109,872	221.0
May	40-49	Within 21 days of first dose	29	82,454	37.9
May	40-49	21 days or more after first dose	247	169,064	145.0
May	40-49	Within 21 days of second dose	55	46,398	114.4
May	40-49	21 days or more after second dose	100	60,846	164.0
May	50-59	Unvaccinated	350	49,609	717.2
May	50-59	Within 21 days of first dose	12	3,925	273.1 u
May	50-59	21 days or more after first dose	817	294,958	275.7
May	50-59	Within 21 days of second dose	205	104,827	190.7
May	50-59	21 days or more after second dose	378	92,554	399.9

However, on table 9 of the 'Deaths by Vaccination Status' dataset, the ONS have inadvertently provided enough details on deaths among children and teenagers by vaccination status for us to calculate the mortality rates ourselves, and to put it bluntly, they are horrifying, and make it obvious as to why the ONS chose to exclude children from the mortality rates dataset.

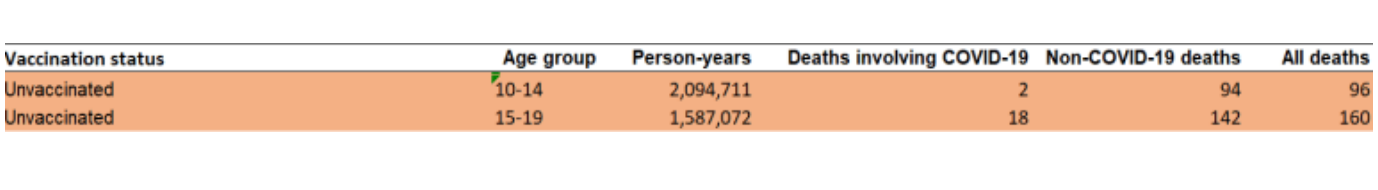
What the ONS have done, as can be seen in the above table, is provide an age standardised mortality rate per 100,000 person-years, rather than per 100,000 population.

The reason for this is that the size of each vaccination status population has been changing all the time, due to the unvaccinated moving into the one-dose category, and the one-dose vaccinated moving into the two-dose vaccinated category throughout the year.

So by doing it this way it provides a much more accurate picture of the mortality rates because it accounts both the number of people and the amount of time a person has spent in each vaccination status.

And on table 9, the ONS have provided us with the number of deaths by vaccination status among children and teenagers, and have kindly also provided us with the person-years, meaning we can calculate the mortality rate per 100,000 person years for 10-14 year olds, and 15-19 year olds by vaccination status.

According to the ONS, between 2nd January and 31st October 2021 there were 96 deaths recorded among 10-14-year-olds who had not been vaccinated, and 160 deaths recorded among 15-19-year-olds who had not been vaccinated.



Vaccination status	Age group	Person-years	Deaths involving COVID-19	Non-COVID-19 deaths	All deaths
Unvaccinated	10-14	2,094,711	2	94	96
Unvaccinated	15-19	1,587,072	18	142	160

The ONS have calculated the person-years among unvaccinated 10-14 year-olds during this period to be 2,094,711, whilst they've calculated person-years among unvaccinated 15-19 year-olds during this period to be 1,587,072.

To work out the mortality-rate per 100,000 person years all we need to now do is divide the person-years by 100,000, and then divide the number of deaths by the answer to that equation.

So for 10-14 year-olds we perform the following calculation –

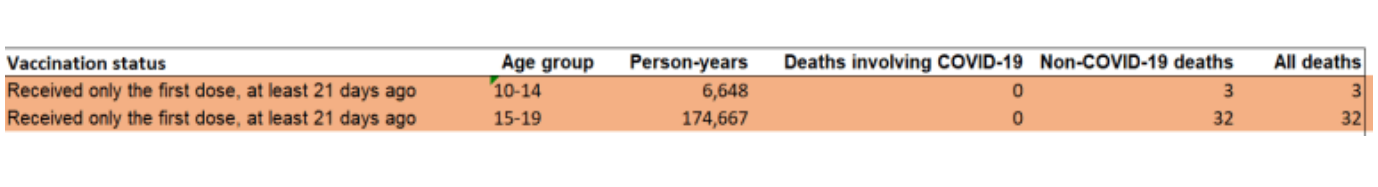
2,094,711 (person-years) / 100,000 = 20.94711

96 (deaths) / 20.94711 = 4.58

Therefore, the mortality rate per 100,000 person-years among unvaccinated 10-14-year-olds is 4.58 deaths per 100,000 person-years between 1st Jan and 31st Oct 21.

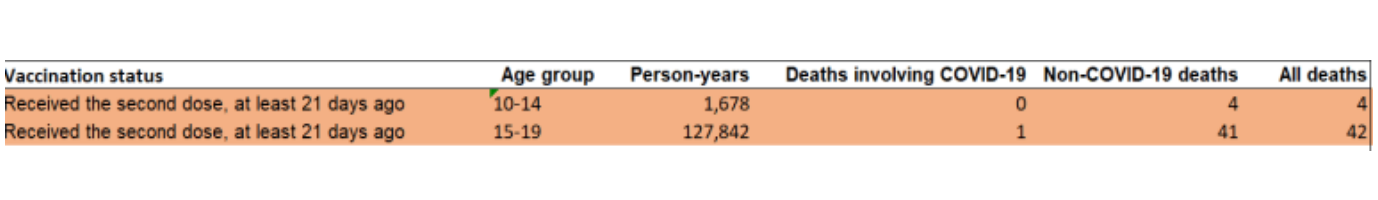
By using the same formula we find that the the mortality rate among unvaccinated 15-19-year-olds is 10.08 deaths per 100,000 person-years.

Now all we have to do is use the same formula to calculate the mortality rate among one-dose vaccinated and two dose vaccinated 10-14, and 15-19 year-olds, by using the person-years and number of deaths provided by the ONS in table 9 of their 'Deaths by Vaccination Status' report, which are as follows –



Vaccination status	Age group	Person-years	Deaths involving COVID-19	Non-COVID-19 deaths	All deaths
Received only the first dose, at least 21 days ago	10-14	6,648	0	3	3
Received only the first dose, at least 21 days ago	15-19	174,667	0	32	32

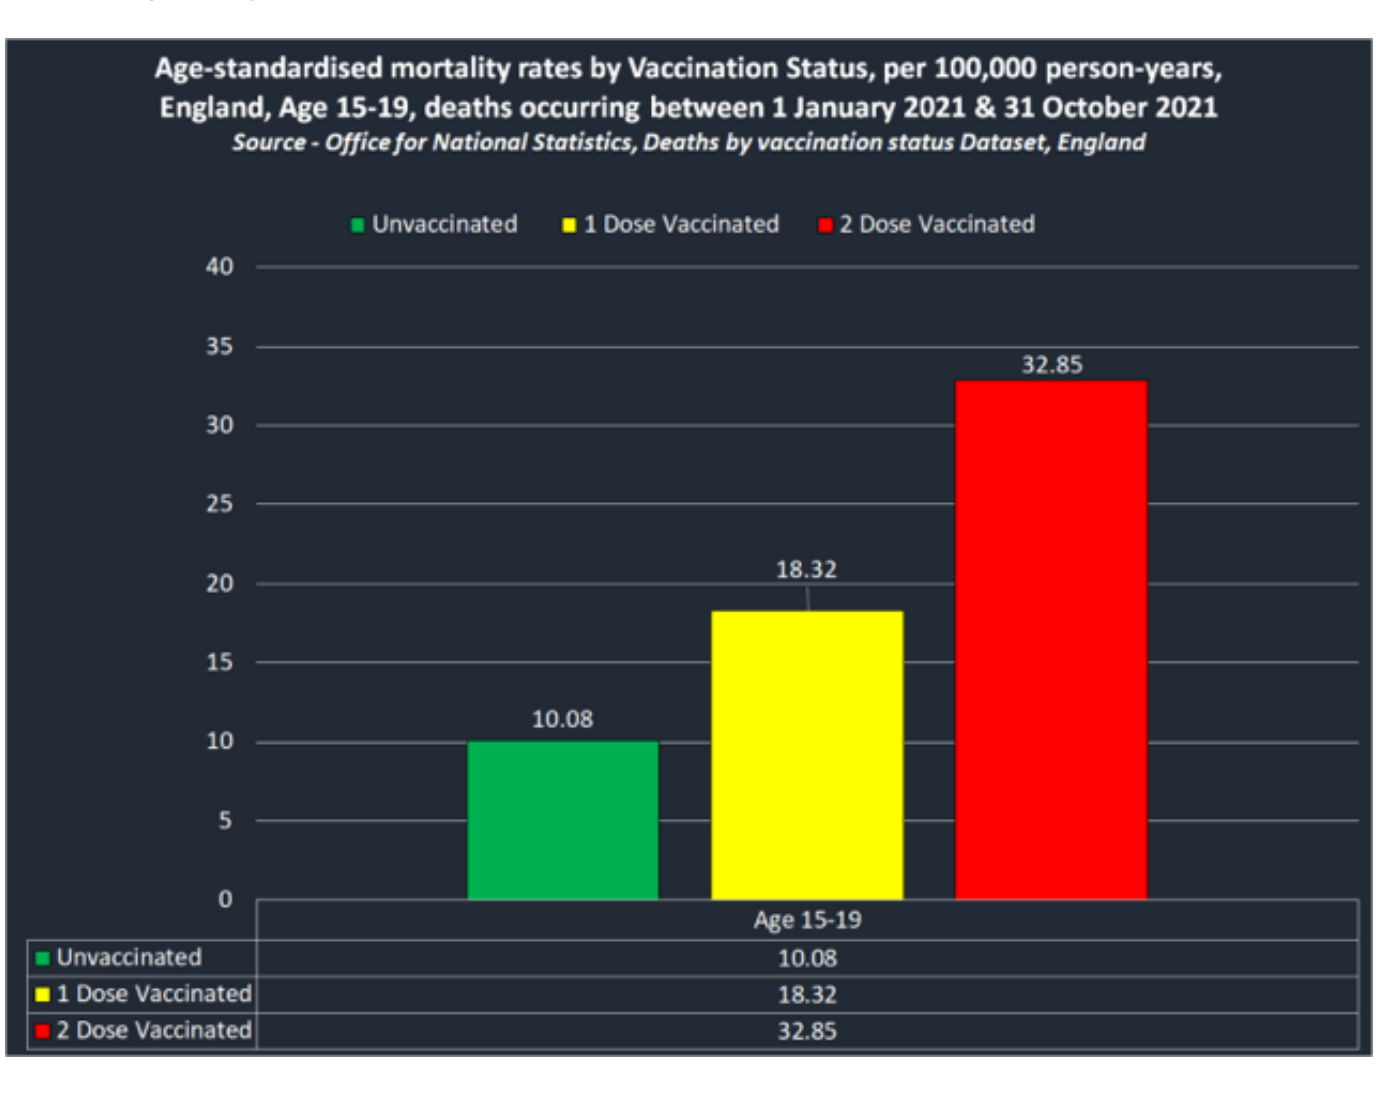
Source Data



Vaccination status	Age group	Person-years	Deaths involving COVID-19	Non-COVID-19 deaths	All deaths
Received the second dose, at least 21 days ago	10-14	1,678	0	4	4
Received the second dose, at least 21 days ago	15-19	127,842	1	41	42

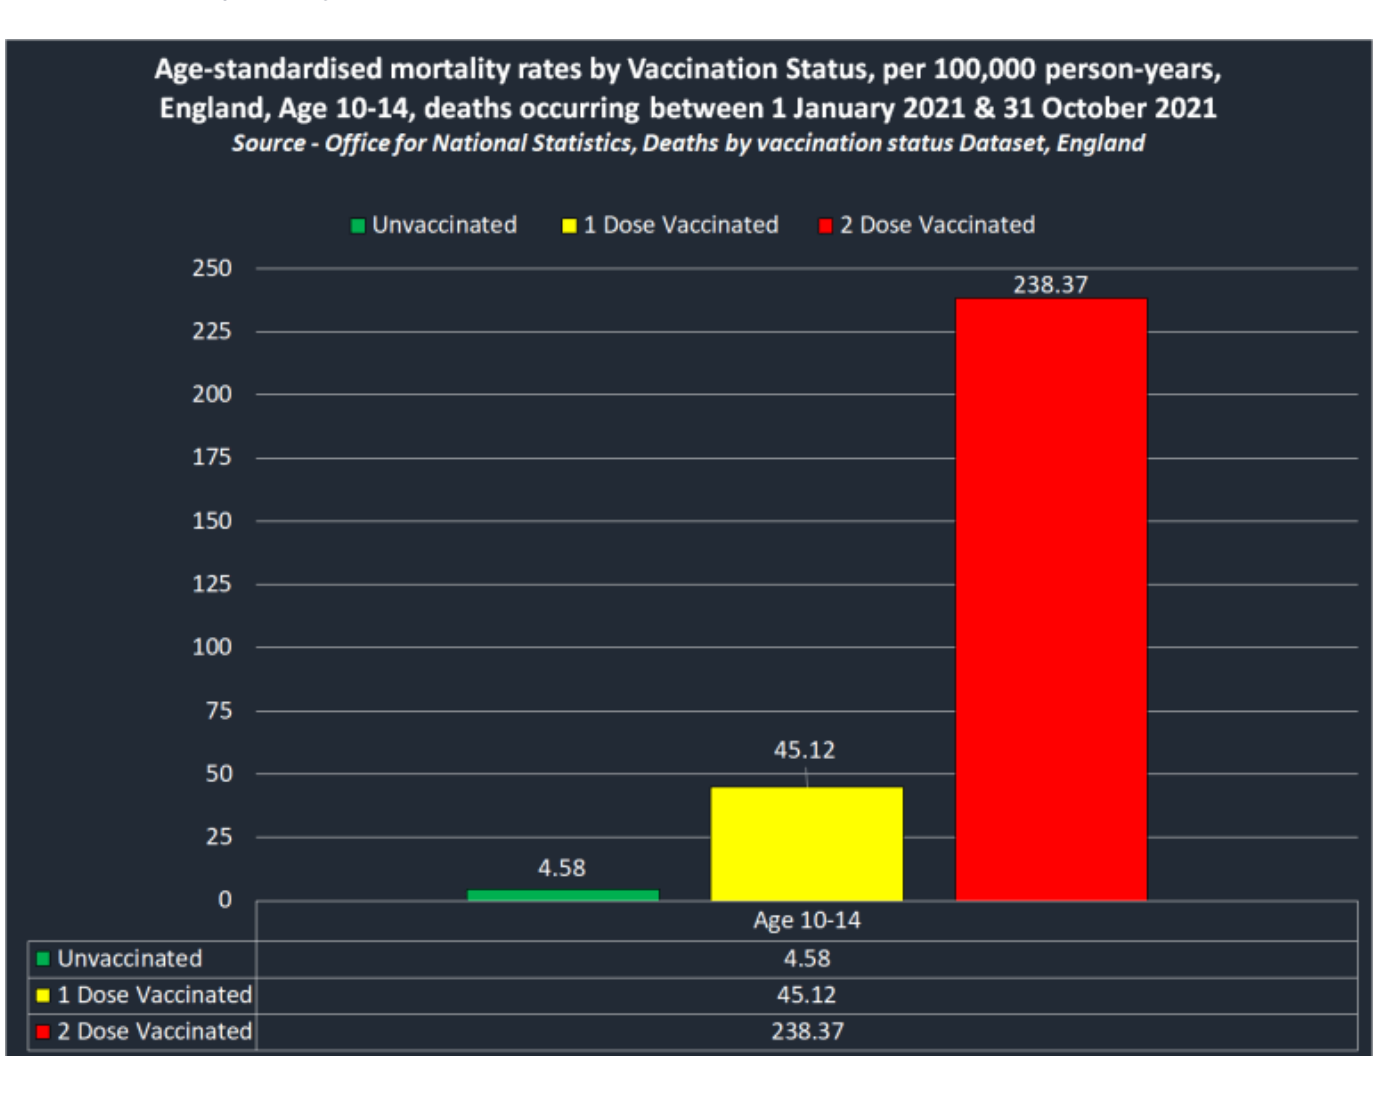
Source Data

Here are the calculated mortality rates by vaccination status among 15-19-year-olds based on the ONS calculated person-years –



Source Data

And here are the calculated mortality rates by vaccination status among 10-14-year-olds based on the ONS calculated person-years –

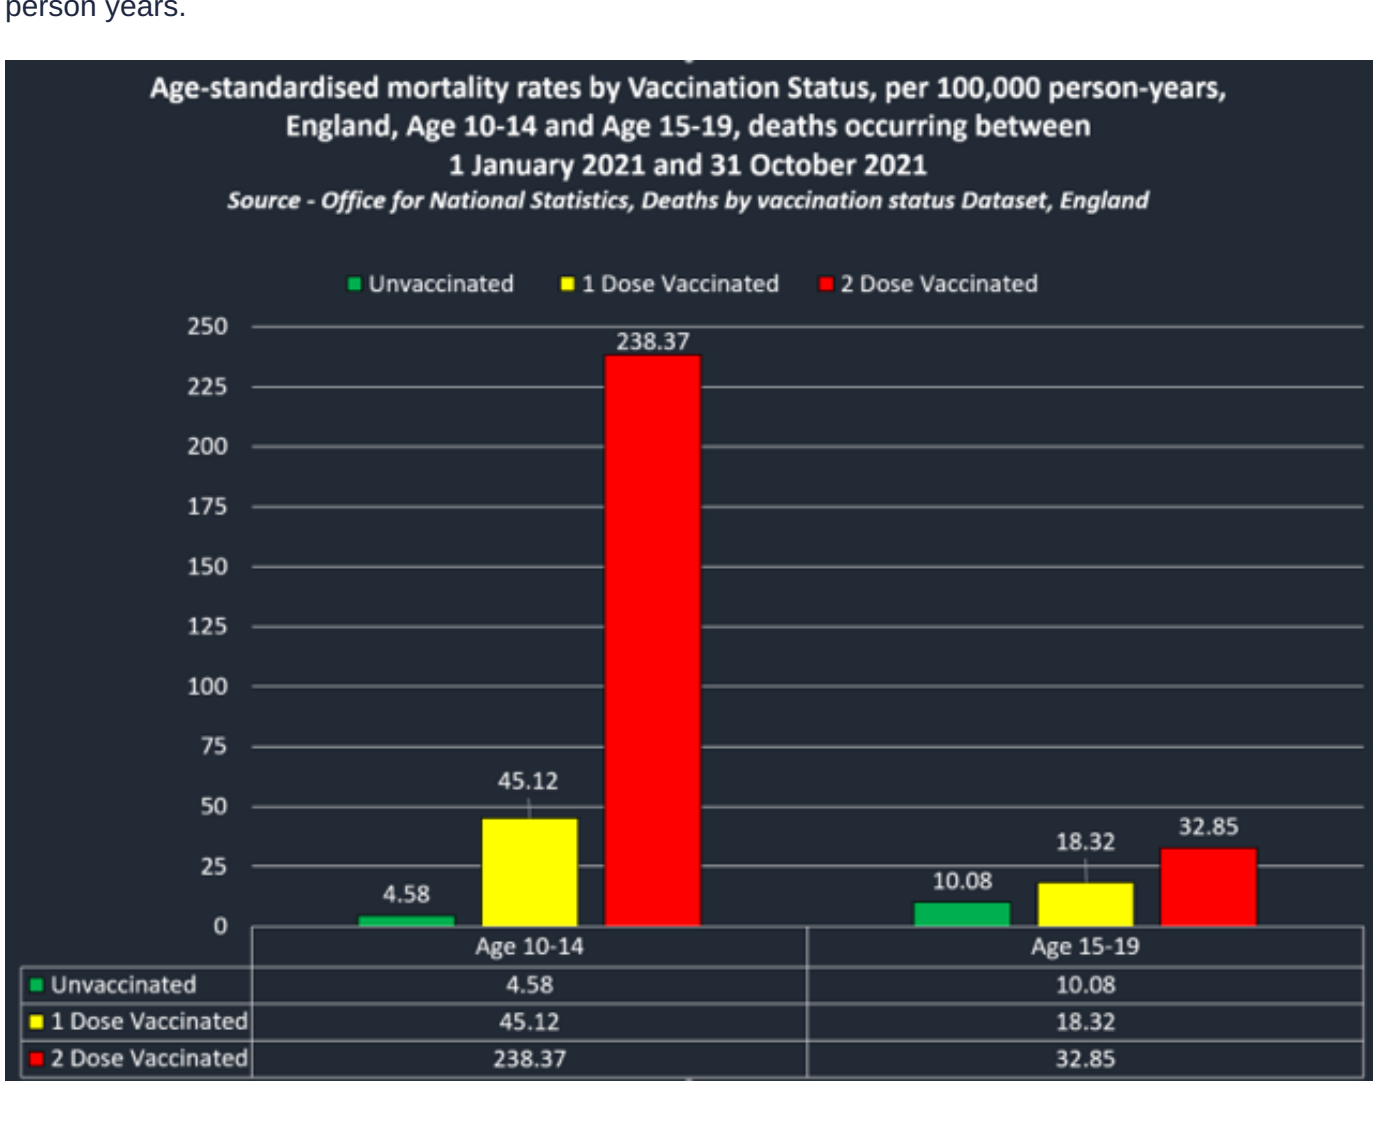


Source Data

These figures are horrifying. The ONS data shows that between 1st Jan and 31st Oct 21, children aged 10-14 were statistically 10 times more likely to die than unvaccinated children, and teenagers aged 15-19 were statistically 2 times more likely to die than unvaccinated teenagers.

But it's the double vaccinated figures that are truly frightening.

The ONS data shows that between 1st Jan and 31st Oct 21, teenagers aged 15-19 were statistically 3 times more likely to die than unvaccinated teenagers, but children aged 10-14 were statistically 52 times more likely to die than unvaccinated children, recording a death rate of 238.37 per 100,000 person years.



Source Data

But these figures are in fact even worse than they first appear, as if they weren't already bad enough. This is because the unvaccinated mortality rate among 10-14-year-olds includes children aged 10 and 11 who are not eligible for vaccination.

Whereas the vaccinated mortality rates do not include 10 and 11 year olds because they were not eligible for vaccination at the time, with the JCVI only recently recommending on 22nd Dec 21 that 5 to 11-year-old children deemed to be high risk should be offered a Covid-19 vaccination.

Therefore, if the Covid-19 injections were not causing the untimely deaths of children then we would actually expect to see a mortality rate that is lower among the vaccinated population than the mortality rate among the unvaccinated population, not a mortality rate that is similar, and certainly not a mortality rate 52 times higher.

This jaw dropping and horrifying data should be national headline news, and we dread to think what the numbers will be in the next update from the ONS which will include data on millions of more children who received their 1st and 2nd dose of a Covid-19 vaccine after October 31st 2021.

the "unvaccinated" numbers are a misnomer, because most deaths after the vaccination, occur within the first 14 days after vaccination, while they are "unvaccinated".
A true picture, would be to include those "first 14 days" from vaccination, which would show a very different picture, don't you think?
Any kid who has NOT been vaccinated, won't suddenly have the vaccines – its parents don't trust vaccines, any more than I do and they won't change their point of view, any more than I will, we will remain not vaccinated, until vaccines are forced on us, against our Will, which probably won't ever happen, because we have to consent to have them and it is our human rights to deny them, under Common Law.

I am creating an honest wage from home 1900 Dollars/week , that is wonderful, below a year gone i used to be unemployed during an atrocious economy. (cfg28) I convey God on a daily basis. I used to be endowed with these directions and currently it's my duty to pay it forward and share it with everybody.
Here is where I started……. http://Www.Self25.com

You are correct but that would only make the figures worse. It could be the most of the unvacciated deaths are themselves vaccinated deaths within the first 14 days of the 1st jab.

Also the 10 and 11 year olds who have not been jabbed will have a mortality 10x smaller than the 12 and 13 year olds who have had one jab. So the deaths in the 12/13 year olds will be 91% of the class numbers not 50% So you can multiply the 1 dose figures by 91/50 i.e. 1.82. So actually the singly vaccinated 12/13 year olds are 18.2x more likely to die not 10x. So the figure would be 82.2 not 45.12

hi everyone. I have a question (I'm a ESL user so plz understand if i use broken English). my question is both groups(unvaxxed and vaxxed)'s denominator sizes are too much difference.
I mean, unvaxxed 10-14 age group students numbers denominator is 2,094,711 about more than 2million, but double vaxxed students numbers of denominator is only(10-14 age group) 1,678, so according to above calculate formula,
unvaxxed(10-14) / 100,000 versus double vaxxed (10-14) / 100,000.
my concern is, unvaxxed denominator size too big rather than double vaxxed denominator. this means, huge number of denominator obviously has advantage against small denominator of double vaxxed denominator.
Even, death rate formula affected by each groups denominator size.
death tall / fatal rate = mortality rate, this means if we consider unvaxxed students number denominator is much smaller like (i.e. 1,678) and on the other hand, double vaxxed students numbers bigger like (i.e. 2million). If we just imagine like this bigger double vaxxed than unvaxxed. the results may big different numbers will come out. In conclusion, may use statics of early 2022 year or very late of 2021, the mortality rate result significantly changed rather than above (in the original this web site article).
I am quite sure the result change like 180 degree turning point. what do you think everyone? I am very sorry to use broken english

What does 'age standardised' mean? Why can't you just say X brats died, instead of using lawyer speak?

> The ONS data shows that between 1st Jan and 31st Oct 21, teenagers aged 15-19 were statistically 3 times more likely to die than unvaccinated teenagers, but children aged 10-14 were statistically 52 times more likely to die than unvaccinated children, recording a death rate of 238.37 per 100,000 person years.

How many brats are poisoned and how many not poisoned?

And why is it all so 'horrifying'? Don't the non brats being snuffed out matter any more? What happened to all the 'caring' about the 100,000 murdered in 'care' homes and "the murderers will pay"? No one's paying, except the taxpayer, and that for more murders.
